RateAnalysis

September 16, 2019

1 Introduction

Validating EBDC online compression throughput using the Supermicro SuperWorkstation 7049GP-TRT, with 2 x Intel Xeon Silver 4216 Processor 16-Core 2.1GHz 32 core CPUs and 128 GB memory.

The data is all 2019 sPHENIX TPC SAMPA data at FTBF total 1+TB. The data are buffered on ASUS Hyper M.2 X16 PCIe 3.0 X4 Expansion Card V2 with four SAMSUNG 970 EVO PLUS M.2 2280 1TB PCIe Gen 3.0 x4 NVMe 1.3 V-NAND configured in 4-strip software RAID0. The RAID is tested to 6GBps write and 11GBps write through its PCIe Gen3 x16 interface, matching a large fraction of the FELIX throughput and suppass the expected average rate in sPHENIX year-5 operation.

The data is readout as parallel jobs via start-compression.sh, and sink via TPC connection to multiple neat processes either at localhost or remote which can be started with start-sink.sh

2 Inputs

```
[1]: # DataDir = './data_tmp/'
DataDir = './data_25x_localhost/'
studytitle = r"$\bf{EBDC}$" + " compression\nlocalhost loopback"

[2]: # %matplotlib widget
# %matplotlib ipympl
%matplotlib inline
# well the html export like dump formats
```

3 Processing

```
